Foreword

Rich Hickey invented Clojure. This is a fork of the project to build Clojure in Common Lisp.

We would like to have these new lisp ideas available in a standard common lisp environment. There will be some language changes due to the loss of Java and some enhancements due to Common Lisp. This is unavoidable but within the spirit of Clojure.

Every effort is made to give credit for any and all contributions.

We are also experimenting with literate programming as a development and documentation technology.

Clojure is a break with the past traditions of Lisp. This literate fork is a break with the past traditions of code development. As such it is intended as an experiment, not a replacement or competition with the official version of Clojure.

Timothy Daly

Preface: Why Literate Programming

This is a literate program, inspired by Donald Knuth [Knu84]. It is intended to be read like a novel from cover to cover. The ideas are expressed clearly but they are grounded in the actual source code.

The code in this documment is the executable source. The chapter [15] building on Building ClojLisp gives the procedure for building a running system from the enclosed sources.

Most programmers are still locked into the idea of making a program out of a large pile of tiny files containing pieces of programs. They do not realize that this organization was forced by the fact that machines like the PDP 11 only had 8k of memory and a limit of 4k buffers in the editor. Thus there was a lot of machinery built up, such as overlay linkers, to try to reconstruct the whole program.

The time has come to move into a more rational means of creating and maintaining programs. Knuth suggested we write programs like we write literature, with the idea that we are trying to communicate the ideas to other people. The fact that the machine can also run the programs is a useful side-effect but not important.

Very few people have seen a literate program so this is intended as a complete working example, published in book form. The intent is that you can sit and read this book like any other novel. At the end of it you will be familiar with the ideas and how those ideas are actually expressed in the code.

If programmers can read it and understand it then they can maintain and modify it. The ideas will have been communicated. The code will be changed to match changes in the idea. We will all benefit.

I've tried to make it as simple as possible. Try it once, you might like it.

Steps to build ClojLisp

Step 1

We will be using SBCL as the initial development environment so you need to get an SBCL version running.

You also need the C program [18] tangle.c which you can clip from this file using a text editor and save it as tangle.c. If you got this file from a git repository the tangle.c program is probably already available. The tangle program is used to extract the source files from this document.

Step 2

Compile tangle.c to create a function called tangle.

```
gcc -o tangle tangle.c
```

Step 3

Run tangle to extract the [22] Makefile from this document.

```
./tangle clojure.pamphlet Makefile >Makefile
```

Step 4

Running make will create a PDF of the documentation and will create the clojlisp.lisp file containing the latest source code.

```
make
```

Step 5

Start lisp, change to the new package, and start the REPL.

```
sbcl
(load "clojlisp.lisp")
(in-package "CLOJLISP")
(clojlisp)
```

The new REPL knows almost nothing at all. In particular, it has no functions and no symbols defined yet so you need to qualify everything. For example,

```
(common-lisp::+ 2 3)
```

To exit the program type:

```
(sb-ext:quit)
```

Steps to change Clojure

Working in literate programming is simple. You need an editor and a command line. Make changes directly to this document using the editor and then type

```
make
```

This will destroy the old source and rebuild the clojlisp.lisp file.

If you change the Makefile section in the document you will have to extract it before the changes take effect:

```
./tangle clojlisp.pamphlet Makefile >Makefile
```

If you are working in Linux it is very effective to use emacs with a split screen. Start a command line in one buffer and a shell in the other buffer. If you start xdvi running in the background you will immediately see the "printed" form of the document every time you switch to the xdvi window.

```
xdvi clojlisp.dvi &
```

The same trick can be used with the PDf file instead. Both xdvi and xpdf will update automatically when the file is changed on disk.

```
xpdf clojlisp.pdf &
```

Resist the urge to edit the clojlisp.lisp file. It is only there for the computer. Edit this file directly. Be sure to write words to communicate your ideas just as you would when writing a book. The machine code is secondary and intended to make the ideas concrete.

Why Bother?

Why bother with such a difficult method of programming? Because worthwhile programs should "live".

Programs "live" because people maintain them. Maintaining and modifying code correctly requires that you understand why the program is written as it is, what the key ideas that make the program work, and why certain, not very obvious, pieces of code exist. Programmers almost never write this information down anywhere. Great ideas are invented, the code is written, a man page of documentation is created, and the job is done.

Well, almost. What does is mean for a program to "live"? How does a program survive once the original developers leave the project? There are many sources of information but almost no source of knowledge. New programmers don't know what the "elders" know. In order to "live" and continue to grow there has to be a way to transmit this knowledge.

Literate programming is Knuth's proposed idea for moving from the world of ideas to the world of information. This is not simply another documentation format. This is meant to be **Literature**. The ideas are presented, the implications are explored, the tradeoffs are discussed, and the code is "motivated", like characters in a novel.

You are encouraged to write or rewrite sections of this document to improve the communication with the readers.

"But I have to learn latex!". Well, for this document you do. But LaTeXis no more than a document markup language like HTML and it is no harder to learn. It gives you the added advantage that you have a real language for publishing real documents. Most books are typeset with this technology and a lot of conferences and Journals require it. If you can learn Clojure, you can learn LaTeX. If you're a programmer you will always need to continue to learn, at least until you retire into management.

Having used literate programming for years I have collected some key quotes that might stimulate your interest.

I believe that the time is ripe for significantly better documentation of programs, and that we can best achieve this by considering programs to be works of literature. Hence, my title "Literate Programming". Let us change our traditional attitude to the construction of programs. Instead of imagining that our main task is to instruct a computer what to do, let us concentrate on explaining to human beings what we want a computer to do.
–Donald Knuth "Literate Programming (1984)"

Step away from the machine. Literate programming has nothing to do with tools or style. It has very little to do with programming. One of the hard transitions to literate programming is "literate thinking".
–Timothy Daly in Lambda the Ultimate (2010)

The effect of this simple shift of emphasis can be so profound as to change one's whole approach to programming. Under the literate programming paradigm, the central activity of programming becomes that of conveying meaning to other intelligent beings rather than merely convincing the computer to behave in a particular way. It is the difference between performing and exposing a magic trick.
–Ross Williams, FunnelWeb Tutorial Manual

Another thing I've been enjoying lately is literate programming. Amazingly it turns out to be faster to write a literate program than an ordinary program because debugging takes almost no time.
–Bill Hart, SAGE Mailing list, May 3, 2010

The conversation is much more direct if the Design Concept per se, rather than derivative representatives or partial details, is the focus.
–Fred Brooks, "The Design of Design"

We are banning the old notion of literate programming that I used when developing TEX82 because documentation has proven to be too much of a pain.
–Donald Knuth TUG 2010

Once upon a time I took great care to ensure that TEX82 would be truly archival so that results obtainable today would produce the same output 50 years from now but that was manifestly foolish. Let's face it, who is going to care one whit for what I do today after even 5 years have elapsed, let alone 50. Life is too short to re-read anything anymore in the internet age. Nothing over 30 months old is trustworthy or interesting.
–Donald Knuth TUG 2010

Chapter 1

From ideas to implementation

Chapter 2

The clojlisp package

We are defining a lisp-in-lisp so there will be a significant number of symbol collisions. We have to be very careful to only import symbols that do not conflict.

— **defpackage clojlisp** —

```
#+:AKCL (make-package "COMMON-LISP" :use '("LISP"))
#+:AKCL (in-package "USER")
#+:SBCL (declaim (sb-ext:muffle-conditions style-warning))
#+:SBCL (declaim (sb-ext:muffle-conditions warning))
#+:SBCL (declaim (sb-ext:muffle-conditions sb-ext:compiler-note))
(make-package "CLOJLISP")
(in-package "CLOJLISP")
```

————-

Chapter 3

Imported functions

We import some functions from other packages which have useful definitions or which match the semantics of Clojure.

— **imported functions** —

```
#+AKCL (lisp::defun bye () (si::bye))
#+SBCL (common-lisp::defun clojlisp::bye () (sb-ext:quit))
```

———-

Chapter 4

The Reader

The reader uses the common lisp reader.

— **defun read** —

```
(common-lisp::defun
  clojlisp::read (
    common-lisp::&optional input-stream eof-error-p eof-value recursive-p)
 (common-lisp::case
   (common-lisp::peek-char
     common-lisp::nil input-stream eof-error-p eof-value recursive-p)
  ((#\0 #\1 #\2 #\3 #\4 #\5 #\6 #\7 #\8 #\9)
     (common-lisp::print "number")
     (common-lisp::terpri)
     (common-lisp::read-char))))
```

————-

Chapter 5

The Evaluator

The evaluator uses the common lisp evaluator.

— **defmacro eval** —

```
(common-lisp::defmacro clojlisp::eval (x) `(common-lisp::eval ,x))
```

———-

Chapter 6

The Printer

The printer uses the common lisp printer.

— **defun print** —

```
(common-lisp::defun clojlisp::print (x) (common-lisp::print x))
```

————-

Chapter 7

The Clojlisp REPL

By typing

```
(load "clojlisp.lisp")
(in-package "CLOJLISP")
(clojlisp)
```

you have a read-eval-print loop (REPL). The REPL knows almost nothing about anything so it can be quite painful. You need to qualify symbols that come from any other package at the moment. A working example is:

```
(common-lisp::+ 2 3)
```

— defun repl —

```
(common-lisp::defun clojlisp::clojlisp ()
 (common-lisp::loop
  (clojlisp::print
    (clojlisp::eval
     (clojlisp::read)))
  (common-lisp::terpri)))
```

———-

Chapter 8

Building ClojLisp

This is the whole source listing in one file. If you define a new chunk, add it here.

8.1 The env global environment

We wrap all of the code in a `let` construct which defines a `env` variable. This variable is accessible from everywhere. It is intended to contain "globally scoped information" such as the current reader setting. Default values are kept in the `env` variable.

The `env` variable is a stack. Managing the `env` as a stack allows us to temporarily push information that overrides existing information.

Functions that require temporary bindings can wrap a let around the function that rebinds `env` with new information cons-ed on the front of the stack. Leaving the let allows the bindings to pop.

8.2 The whole thing

— **clojlisp** —

```
\getchunk{defpackage clojlisp}
\getchunk{imported functions}
(common-lisp::let (env)

\getchunk{defun read}
\getchunk{defmacro eval}
\getchunk{defun print}
\getchunk{defun repl}

)
```

———-

8.3 tangle.c

The tangle program extract pieces of this document and puts them in a file. Any piece that can be extracted is called a "chunk". Each chunk is in a LaTeX**chunk** environment. The tangle program expects two arguments, the name of this file and the chunk to extract as in:

```
./tangle clojure.pamphlet clojlisp
```

It outputs the chunk to standard output. To be useful, redirect the output to a file as in:

```
./tangle clojure.pamphlet clojlisp >clojlisp.lisp
```

This trivial function walks the document looking for the named chunk. When it finds it the chunk is printed to standard output. The only exception is if the chunk contains a **getchunk** markup. This is used to embed other chunks inline. So tangle will pause the output of the current chunk, find and print the getchunk reference, and then continue. Of course, if the getchunk reference contains an embedded getchunk we recurse into it. This program could be a lot smarter ... but why?

— **tangle.c** —

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <sys/stat.h>
#include <sys/mman.h>
#include <sys/types.h>
#include <fcntl.h>

#define DEBUG 0

/* forward reference for the C compiler */
int getchunk(char *chunkname);

/* a memory mapped buffer copy of the file */
char *buffer;
int bufsize;

/* return the length of the next line */

    exit(-1);
  }
  fd = open(argv[1], O_RDONLY);
  if (fd == -1) {
    perror("Error opening file for reading");
    exit(-2);
  }
  if (fstat(fd,&filestat) < 0) {
    perror("Error getting input file size");
    exit(-3);
  }
  bufsize = (int)filestat.st_size;
  buffer = mmap(0,filestat.st_size,PROT_READ,MAP_SHARED,fd,0);
  if (buffer == MAP_FAILED) {
    close(fd);
    perror("Error reading the file");
    exit(-4);
  }
  getchunk(argv[2]);
  close(fd);
  return(0);
}
```

———-

8.4 Makefile

This book is actually a literate program[Knu84] and can contain executable source code. In particular, the Makefile for this book is part of the source of the book and is included below.

You can extract this chunk with an editor or use the tangle function:

```
./tangle clojlisp.pamphlet Makefile >Makefile
```

— **Makefile** —

```
PROJECT=clojlisp
TANGLE=tangle
LATEX=/usr/bin/latex
MAKEINDEX=/usr/bin/makeindex
UUDECODE=uudecode
PDF=dvipdf

all:
${TANGLE} ${PROJECT}.pamphlet ${PROJECT} >${PROJECT}.lisp
${TANGLE} ${PROJECT}.pamphlet clojureIcon.eps.uu >clojureIcon.eps.uu
${UUDECODE} clojureIcon.eps.uu
${LATEX} ${PROJECT}.pamphlet
${MAKEINDEX} ${PROJECT}.idx
${LATEX} ${PROJECT}.pamphlet
${PDF} ${PROJECT}.dvi

clean:
rm -f ${PROJECT}.aux ${PROJECT}.idx ${PROJECT}.ilg ${PROJECT}.ind
rm -f ${PROJECT}.log ${PROJECT}.out ${PROJECT}.toc ${PROJECT}.aps
rm -f ${PROJECT}.dvi *.eps.uu *~ clojureIcon.eps
```

————-

8.5 The Clojure Icon

This document uses the Clojure Icon on the front page. This is a uuencoded, encapsulated postscript version of the icon. You can recreate the **clojureIcon.eps** file with:

```
./tangle clojlisp.pamphlet clojureIcon.eps.uu >clojureIcon.eps.uu
uudecode clojureIcon.eps.uu
```

— **clojureIcon.eps.uu** —

```
